Management of Extended Parotid Tumors Oct 22 2019 This extensively illustrated book aims to systematize the selection of treatment options in patients with parotid tumors that extend beyond the borders of the parotid tissue and therefore present particular problems for the surgeon. Reconstruction of the postoperative defect is especially difficult in such cases because of the complexity and density of the anatomical structures in the lateral region of the head and neck and also the general condition of most patients, who tend to be elderly and to have accompanying disorders. The difficulty in the management of extended parotid tumors is increased by the need to sacrifice the facial nerve, even if only partially. The book provides clear criteria to assist in the choice of treatment, from the simplest options involving use of local flaps to the most sophisticated ones. It will assist the surgeon in ensuring that the patient achieves the best possible quality of life, no matter what the patient's age or the associated comorbidities.

Difficult Diagnoses in Breast Pathology Jan 05 2021 Breast cancer is the second leading cause of cancer death in women in the United States. For the pathologist, almost any breast lesion may produce diagnostic difficulty, especially due to frequently small samples (core biopsy specimens) and a variety of mimics and variants seen in specific types of lesions. Additionally, the difficulty of breast lesion diagnosis has risen dramatically in recent years due to the increased emphasis on stratifying patients for appropriate therapy on an individual basis; the wider range of both local and systemic therapeutic options, and the potential for earlier diagnosis through increased mammographic breast screening leading to a higher likelihood of a favorable outcome. *Difficult Diagnoses in Breast Pathology* will have a special focus on the most difficult diagnostic problems in breast disease for the surgical pathologist: needle core biopsy interpretation, diagnosis of precursor lesions and early stage disease, recognition of neoplastic mimics and other misleading variants, and other particularly difficult areas including appropriate use of newer immunohistochemical markers, where appropriate. Prognostic questions and early staging of special importance in the pathologist's collaboration with oncology clinicians and, increasingly, in informing patients and participating in ongoing management assessment. Throughout, the emphasis will be on a visual presentation with high-quality images on the more difficult problems and questions that the pathologist is likely to have in evaluation of breast disease
