E. Franklin Frazier and Black Bourgeoisie Aug 02 2022 When E. Franklin Frazier was elected the first black president of the American Sociological Association in 1948, he was established as the leading American scholar on the black family and was also recognized as a leading theorist on the dynamics of social change and race relations. By 1948 his lengthy list of publications included over fifty articles and four major books, including the acclaimed *Negro Family in the United States*. Frazier was known for his thorough scholarship and his mastery of skills in both history and sociology. With the publication of *Bourgeoisie Noire* in 1955 (translated in 1957 as *Black Bourgeoisie*), Frazier apparently set out on a different track, one in which he employed his skills in a critical analysis of the black middle class. The book met with mixed reviews and harsh criticism from the black middle and professional class. Yet Frazier stood solidly by his argument that the black middle class was marked by conspicuous consumption, wish fulfillment, and a world of make-believe. While Frazier published four additional books after 1948, *Black Bourgeoisie* remained by far his most controversial. Given his status in American sociology, there has been surprisingly little study of Frazier's work. In *E. Franklin Frazier and Black Bourgeoisie*, a group of distinguished scholars remedies that lack, focusing on his often-scorned *Black Bourgeoisie*. This in-depth look at Frazier's controversial publication is relevant to the growing concerns about racism, problems in our cities, the limitations of affirmative action, and the promise of self-help.

Processing Mathematics Through Digital Technologies Mar 17 2021 Digital technologies permeate our lives. We use them to communicate, research, process, record, and for entertainment. They influence the way we interact in the world, the way we live. Digital technologies also offer the potential to transform the nature of the learning process in mathematics. The learning environment, the types of tasks learners can engage with, and the nature of

that engagement differs from working in other environments. The Internet, for instance, presents greater scope for child-centered, inquiry-based learning. Dynamic geometry software and GoogleEarth offer interactive ways of exploring shape, position and space that is not possible with the pencil-and-paper medium. This book provides insights into how mathematical understanding emerged for primary-aged children (5-13 years) when they investigated mathematical tasks through digital media. It considers learning theories that are frequently used in mathematics education, and situates a contemporary interpretive approach within those perspectives. A key purpose was to provide some practical tasks for teachers/teacher educators to incorporate digital technologies into their mathematics programmes, tasks that have been used successfully for learning. This is a significant reference book for primary-school teacher education and a valuable resource for all schools teaching at that age.
