EMDR Toolbox Nov 11 2020 "[R]eading this book has given me a whole host of new ideas about working with complex and dissociative clients... Clear and engaging, peppered with relevant case histories, this book would make an important addition to anyone's EMDR-related book collection." -- Dr. Robin Logie, EMDR UK & Ireland This book is the first to bring together in one volume an overview of the principal issues in treatment of dissociative disorders in complex PTSD, and a description of the integration of specific EMDR-related interventions or "tools" with other psychotherapeutic treatments. These tools can significantly extend the therapeutic power of EMDR-related methods. Each intervention is examined in detail with accompanying transcripts illustrating the nuances and variations in how the intervention is applied. It is written by a highly esteemed EMDR scholar, trainer, international speaker, and author who is an EMDRIA-designated "Master Clinician." The book discusses how the concepts and vocabulary of other models of dissociation (particularly the Theory of Structural Dissociation of the Personality, and the Internal Family Systems model) translate directly into EMDR's Adaptive Information Processing language. It presents detailed descriptions of specific EMDR-related tools that are useful in facilitating and safely accelerating therapeutic progress with clients suffering from Complex PTSD. These include such standard EMDR procedures as Trauma Processing and Resource Installation, several conceptual/cognitive/phenomenological models of dissociative personality structures and symptoms, and specific EMDR interventions for resolving dysfunctionally stored post-traumatic elements. The book will be of great value to therapists who wish to extend their use of basic EMDR with "easier" clients to using it effectively with more complex clients. Key Features: Provides a theoretical framework to guide assessment and treatment of clients with Complex PTSD Serves as a "hands-on" resource for using specific EMDR procedures Describes each intervention in detail, illustrating the nuances and variations in different applications Includes specific "AIP" tools, actual therapy scripts and client drawings Covers DSM-V PTSD criteria

Treatment of Esophageal and Hypopharyngeal Squamous Cell Carcinoma Aug 09 2020 Squamous cell carcinoma of the esophagus has a lower incidence than other gastrointestinal tract cancer; however, there are many difficult issues related to the choice of appropriate therapy for these patients. In recent years, the use of multimodal treatment has greatly improved the prognosis of patients affected by this disease. Several aspects of the oncological and surgical management are still controversial. This book aims to give a homogeneous approach to

esophageal cancer treatment, based on the author's lifetime experience in conjunction with exhaustive review of recent literature. In each chapter surgeons and oncologists will find appropriate tools for correct management of the diagnosis and therapy of this difficult disease. This book analyzes all the aspects of staging and treatment, such as modern diagnostic and staging techniques (MRI or PET-CT), endoscopic treatment of early cancer, new minimally invasive and open surgical techniques, and combined treatment. In addition, there are chapters dedicated to the postoperative course of these patients, as well as their quality of life, with indications for the correct follow-up and treatment relapses.

The Prevention and Treatment of Missing Data in Clinical Trials 04 2022 Randomized clinical trials are the primary tool for evaluating new medical interventions. Randomization provides for a fair comparison between treatment and control groups, balancing out, on average, distributions of known and unknown factors among the participants. Unfortunately, these studies often lack a substantial percentage of data. This missing data reduces the benefit provided by the randomization and introduces potential biases in the comparison of the treatment groups. Missing data can arise for a variety of reasons, including the inability or unwillingness of participants to meet appointments for evaluation. And in some studies, some or all of data collection ceases when participants discontinue study treatment. Existing guidelines for the design and conduct of clinical trials, and the analysis of the resulting data, provide only limited advice on how to handle missing data.

Thus, approaches to the analysis of data with an appreciable amount of missing values tend to be ad hoc and variable. The Prevention and Treatment of Missing Data in Clinical Trials concludes that a more principled approach to design and analysis in the presence of missing data is both needed and possible. Such an approach needs to focus on two critical elements: (1) careful design and conduct to limit the amount of impact of missing data and (2) analysis that makes full use of information on all randomized participants and is based on careful attention to the assumptions about the nature of the missing data underlying estimates of treatment effects. In addition to the highest priority recommendations, the book offers more detailed recommendations on the conduct of clinical trials and techniques for analysis of trial data.

Differential Diagnosis and Treatment of Children with Speech Disorders Mar 02 2020 Paediatric speech and language therapists are challenged by diminished resources and increasingly complex caseloads. The new edition addresses their concerns. Norms for speech development are given, differentiating between the emergence of the ability to produce speech sounds (articulation) and typical development

error patterns (phonology). The incidence of speech disorders is described for one UK service providing crucial information for service management. The efficacy of service provision is evaluated to show that differential diagnosis and treatment is effective for children with disordered speech. Exploration of that data provides implications for prioritising case loads. The relationship between speech and language disorders is examined in the context of clinical decisions about what to target in therapy. New chapters provide detailed intervention programmes for subgroups of speech disorder: delayed development, use of atypical error patterns, inconsistent errors and development verbal dyspraxia. The final section of the book deals with special populations: children with cognitive impairment, hearing and auditory processing difficulties. The needs of clinicians working with bilingual populations are discussed and ways of intervention described. The final chapter examines the relationship between spoken and written disorders of phonology.
