 A Gateway To Modern Mathematics Vol-1   Jun 08 2020 A Gateway to Modern Mathematics: Adventures in Iteration I is the first of a two-volume work on iterations in the RMS series Little Mathematical Treasures. The books in this series address senior secondary school students who are interested in exploring mathematics a little beyond what the school curriculum offers. Iterations is an exciting topic of study and should interest both the amateur as well as the professional. Many of the iterations in elementary mathematics offer scope for extended investigation. They are like a gateway to important themes of modern mathematics such as fractals and chaos and offer a route for experiencing the experimental and visually aesthetic side of mathematics. This book, which is at an elementary level, introduces the idea of iteration. It also explores various associated notions like fixed points, orbits, cycles, limit points, convergence, solution of equations and cobwebbing. It contains a large number of illustrative examples from the world of arithmetic, algebra and geometry. Students preparing for the mathematical Olympiads will benefit from a study of the book, and teachers who run mathematics clubs will find here a rich source of material.

 Junior High School Mathematics   Aug 30 2019 Excerpt from Junior High School Mathematics, Vol. 1 During the first six grades the pupil has learned to compute with some skill, using whole numbers, fractions, and decimals. The work of these grades was necessarily centered around an arithmetical topic and the pupil had but little opportunity to apply his knowledge except to problems involving the topics studied. But to continue such a division of topics results not only in a loss of interest in the subject, but in a very inadequate training in using mathematics to answer the quantitative questions that necessarily arise in the varied Interests and activities of life. This series of mathematical textbooks assumes a knowledge of the arithmetical processes, and after a brief review of them in Book I the entire series centers the thought about some social issue and uses whatever mathematics is needed to answer the questions that naturally arise in an intelligent study of the issue. Such an arrangement is used not merely to give an increased interest in the study, but to develop the power to apply mathematics to the quantitative phases of life and to develop the habit of raising questions needed to interpret more Lilly the quantitative side of life. It should be noticed, then, that this series especially emphasizes the interpretative power of mathematics and seeks to develop both the power to see and the habit of seeing the quantitative relationships that necessarily arise in topics of general conversation and reading. This necessarily involves the use of large numbers, for our newspapers and magazines are now full of such numbers in their discussions of the production and consumption of the world's necessities. Hence, certain chapters involving such numbers are given, in order to train the pupil to interpret them more intelligently.  Reeds Vol 1: Mathematics for Marine Engineers   Feb 03 2020 This exciting new edition covers the core subject areas of arithmetic, algebra, mensuration in 2D and 3D, trigonometry and geometry, graphs, calculus and statistics and probability for Marine Engineering students. Initial examples have been designed purely to practise mathematical technique and, once these skills have been mastered, further examples focus on engineering situations where the appropriate skills may be utilised. The practical questions are primarily from a marine engineering background but questions from other disciplines, such as electrical engineering, will also be covered, and reference made to the use of advanced calculators where relevant.
 New Tertiary Mathematics   May 20 2021 New Tertiary Mathematics, Volume 2, Part 2: Further Applied Mathematics deals with various topics of theoretical mechanics and probability, from statics and the dynamics of a rigid body to the dynamics of a particle with one and two degrees of freedom. Many examples of varying difficulty are worked in the text and exercises are added after each major topic is covered. This book is comprised of five chapters and opens with a discussion on statics, with particular reference to the analysis of systems of forces in three dimensions, along with virtual work, stability, and the catenary. Complicated equilibrium problems are considered. The reader is then introduced to the dynamics of a particle in one and two dimensions, as well as the implications of the Galilean transformation and the

general theorems of motion for a system of particles. These theorems are applied to simple cases of the motion of a rigid body. The final chapter on probability examines normal and Poisson distributions, Markov chains, and miscellaneous problems. This monograph will be a useful resource for mathematical pupils and students engaged in private study.

Countdown to Mathematics   Sep 04 2022 Countdown to Mathematics has been written to help self-study students to revise and practise basic skills in arithmetic, algebra, geometry, graphs and trigonometry. The nine teaching modules in Countdown to Mathematics have been split into two separate books. Volume 1 consists of Modules 1-4 and concentrates on basic mathematical skills. It deals with arithmetic, simple algebra, how to plot and read graphs, and the representation of data. Where possible, the techniques are illustrated with real-world applications. Volume 2 consists of Modules 5-9 and covers geometry, graphs, trigonometry and algebra.. The emphasis here is on the manipulative skills which are necessary for most mathematical courses beyond GCSE standard.

History of Mathematics   Dec 15 2020 Within this two-volume edition, Professor Smith covers the entire history of mathematics in the Near and Far East and the West, from primitive number concepts to the calculus. His account is distinguished by impeccable scholarship combined with unusual clarity and readability. Footnotes add many technical points outside the book's actual line of development and direct the reader to disputed matters and source readings. Hundreds of illustrations from Egyptian papyri, Hindu, Chinese, and Japanese manuscripts, Greek and Roman texts, Medieval treatises, maps, portraits, etc. are used along with modern graphs and diagrams. Every major figure from Euclid to Descartes, Gauss, and Riemann and hundreds of lesser-known figures — Theon of Smyrna, Rabbi ben Ezra, Radulph of Laon, Mersenns, Benedetti, and more — are considered both with respect to specific problems and with an awareness of their overall influence on mathematics. Volume II: Special Topics, considering mathematics in terms of arithmetic geometry, algebra, trig, calculus, calculating machines, and other specific fields and problems. 192 Topics for Discussion. 195 illustrations. Index.

Constructivism in Mathematics   Jan 16 2021 Studies in Logic and the Foundations of Mathematics, Volume 123: Constructivism in Mathematics: An Introduction, Vol. II focuses on various studies in mathematics and logic, including metric spaces, polynomial rings, and Heyting algebras. The publication first takes a look at the topology of metric spaces, algebra, and finite-type arithmetic and theories of operators. Discussions focus on intuitionistic finite-type arithmetic, theories of operators and classes, rings and modules, linear algebra, polynomial rings, fields and local rings, complete separable metric spaces, and located sets. The text then examines proof theory of intuitionistic logic, theory of types and constructive set theory, and choice sequences. The book elaborates on semantical completeness, sheaves, sites, and higher-order logic, and applications of sheaf models. Topics include a derived rule of local continuity, axiom of countable choice, forcing over sites, sheaf models for higher-order logic, and complete Heyting algebras. The publication is a valuable reference for mathematicians and researchers interested in mathematics and logic.
